SUMMARY

Final-year Computer Engineering student and Software Engineering Intern at WSO2. I build reusable, composable, themeable self-service identity components for ThunderID across the React, Next.js, Vue, Nuxt and Express SDKs, and contribute to the ThunderID Go backend and the JavaScript SDK monorepo. Outside identity I work on ML models and embedded robotics.

EXPERIENCE

Software Engineering Intern, WSO2

[START] to present · [LOCATION]

- Built reusable, composable self-service identity components for ThunderID across React, Next.js, Vue, Nuxt and Express SDKs, sharing one theming contract.
- Contributed to the ThunderID Go backend and the JavaScript SDK monorepo ([METRIC] merged PRs).
- Designed components to be themeable through design tokens (colour, radius, typography, density) so integrators can match their brand without forking.

PROJECTS

ESP32-S3 autonomous robot

Firmware with obstacle avoidance, cliff detection, gyroscope-based rotation, turbo/eco vacuum modes, and a strict no-backward-movement constraint.

Power-trace detection (final-year project)

Detection pipeline over power traces. Found and fixed a threshold-overwrite bug that silently replaced the configured threshold. [METRIC] .

EV battery prediction model

Model predicting [TARGET, e.g. state of health] , deployed as a Hugging Face Space. [METRIC] .

EDUCATION

BSc (Hons) in Computer Engineering

General Sir John Kotelawala Defence University · [START YEAR] to [2027]

Final year. Final-year project: [FYP TITLE] .

SKILLS

Languages	TypeScript, JavaScript, Go, Python, C/C++ `[VERIFY]`
Frameworks	React, Next.js, Vue, Nuxt, Express
ML	`[ML FRAMEWORK]`, Hugging Face
Embedded	ESP32-S3, IMU / gyroscope, Sensor integration
